Mr. Albert Trull
Florida State University

REPORT ON ARTHUR G. DOZIER SCHOOL FOR BOYS

W. L. Maloy

I. INTRODUCTION:

During the past four months I have had the opportunity to work frequently and closely with members of the professional staff at the Arthur G. Dozier School for Boys in Marianna. This association has been the result of the academic departments' self study project. Serving with me has been Mr. Jerry Braden and Mr. Edward Wilson, advanced graduate students, Department of Educational Administration.

This close association has included interviews with the Superintendent, members of his staff, school faculty and clerical personnel, house fathers and social service support personnel. Throughout our work with faculty groups and during the special interviews and meetings everyone was extremely cooperative. One cannot help but believe the general posture of the Institution's personnel is that of trying to provide a more suitable experience for the young people under their care--though I should add the developmental/treatment concept is not an operational framework agreed upon by all.

II. GENERAL IMPRESSIONS:

Our major task was that of helping the staffs at the Junior and Senior Schools look more closely at their academic program as a vehicle of support to the treatment concept. Even from this vantage point it becomes readily apparent that the academic program is in itself irrelevant unless it is an integral part of a well planned, well executed Institutional/educational experience. In this vein, it is interesting to note that there is no overt uncooperativeness among the Institution staff; rather, there appears to be a lack of cooperation which seems a condition of default rather than design. For example, there appears to be no inter-institutional guidelines to encourage

and/or accomplish cross-departmental dialogue. Perhaps much of this impression is but a mirror of the uncertainty and uncomfortableness which surrounds the superintendency question. Too, in the academic department, the implications of the self study--especially those which reflect major time requirements for professional improvement--are, indeed, disquieting. One should note this is wholly understandable when personnel throughout the system feel they are experiencing severe financial exploitation. Stated simply, there is a morale problem and it may be detracting seriously from the achievement of Institutional and Divisional goals.

Some of the undercurrent of uncertainty may clear up when the superintendency question is resolved. Yet, it would be reckless optimism to think that a treatment concept can become fully operational under the existing circumstances. The requirements of a treatment environment demand the highest type of coordinated implementation; the highest type of skilled integrated instructional personnel intervention. But geography, salary schedules and limitations in physical and material resources conspire to make this quality instructional mix unavailable at the Boys School. How long it remains unavailable is not dependent upon the resolution of a single variable.

Still, there is much that can be done to improve the setting in which these boys must live and learn. Some problems will require inter-agency cooperation and program development which can be achieved to greater or lesser degree. Some advancements can be accomplished through Division changes in policies, procedures and priorities. Many instructional improvements are within the grasp of the academic staff of the

Institution. Furthermore, as suggested above, many of the activities which can be undertaken are not "academic" per se, but they are certainly educational in nature and, as such, demand total school cooperation and coordination. It is in this light the recommendations outlined below are made.

III. RECOMMENDATIONS:

A. Organizational Structure:

1. A full task analysis, along with job inventories, should be conducted for the entire Institution. This would allow the administrative staff to look seriously at the types of responsibilities which must be accounted for in keeping with the mission of the School; then recruiting and/or assigning personnel in keeping with those responsibilities. This type of a thorough analysis should also suggest that areas where additional staff, perhaps differentiated in scope, are needed and should be procured immediately and over a long range period. It should also suggest recruiting strategies as further outlined below. In addition, this type of inventory should also provide a somewhat realistic review of financial commitments which must be made in getting the quality personnel demanded for the Institution's program.
2. There is a need to look carefully at the administrative structure of the School with an eye toward developing a deputy or associate superintendent whose office has the sole responsibility of coordinating the activities and program experiences to be provided by the academic department, the home life department and

the work crew department. It is my belief this is a kind of critical ingredient which must be clearly reflected in the School's table of organization so that the concept of treatment and human development can be carried on over a united front in working with the boys at the School and in working with the professional staff in development programs.

3. A strong component of the treatment concept program should be a Research and Development activity. The School has a unique opportunity to provide an R&D environment in which systematic efforts are made to relate and articulate the educational specifications of each aspect of its program. Twenty-four hour involvement with the boys is, indeed, an excellent opportunity to intervene in a variety of ways upon their behavioral patterns. Most important, this type of program may hold great promise in being able to provide local professionals with basic information as to how to and how not to provide for these young people in the home school-community setting. Specifically, the R&D component of the School may be able to provide clues to the type of total community educational patterns which may be brought to bear to have a positive and continuing influence on these young men's lives. In addition, the systems concept of R&D is critical to the kinds of information which must be brought to bear to ensure the most adequate clinical experience for each boy. Some inter-agency cooperative program is essential to this task for operational characteristics would include the adequate flow of information between the Institution and the community.

4. Of equal importance to the organizational concept is the need to look rationally at the kinds of youngsters who are placed in the care of the Youth Services Division. For example, some consideration must be given to whether children undergoing this type of treatment can benefit from the environment. Severe mentally handicapped children cannot be served adequately under existing conditions; perhaps not under ideal conditions either. Yet, it may be equally inappropriate to place them in Sunland Hospitals. Again, inter-agency program development should be of primary importance and, thus, receive priority consideration as part of overall Institutional planning.

B. Personnel Considerations:

1. There is a need to seriously re-examine staff recruitment practices. A major ingredient of this area is the existing salary schedule which does not adequately provide for experience, advanced training, differentiated responsibility patterns and procurement capabilities for highly technical support personnel. It should be recognized that this, in itself, represents a potential morale problem but, more important, it places in jeopardy the entire treatment concept. Again, this appears to be a major component of long range Division planning. Perhaps some type of recruiting procedure and internship program could be established with the geographically appropriate Institutions of higher learning. This is not to suggest a two or three day a week "run in - run out" operation. Rather, it implies a one quarter to one year or more internships with continuity factors University

personnel monitoring and staff training programs beamed toward this type of planned turnover. Perhaps some contractual arrangements between University departments and Institutional departments could become one type of personnel procurement model to be developed. This might be particularly useful in the case of high level clinical services which are otherwise extremely expensive to provide. At the present time many of the Institution's "good" people, with high personal and professional aspirations, tend to be constantly looking for other employment. Without adequate pay differentials and without unique techniques to attract highly skilled people to a stimulating professional environment it is not likely a treatment concept will be realistically achieved.

2. The continued systematic upgrading of staff is an equally important personnel consideration. Initially this harks back to a realistically devised salary capability which rewards maximal professional growth. It is difficult to imagine any environment that would require a more elaborate and orchestrated type of faculty development program than this one the Division is attempting to provide. It should be noted this environment includes not only the availability of substantial human resources but also extensive material resources; each articulated with the other in such a manner as to support and extend the program's positive influence throughout the entire Institution. For example, the expanding of the children's self-concepts through positive reinforcement training of faculty in the academic unit can be expected to have a greater influence if a similar program can be designed for house fathers and work crew

supervisors. Similarly, clinical support personnel will have a greater impact if their observations related to staff behavior can be the basis for total Institutional staff upgrading activities.

C. Educational Observations:

1. The concept advanced by the academic faculty in their self study that their major instructional thrust should be toward attitudinal change is one to be applauded and encouraged. But encouragement must be backed up with realistic financial resources and supporting policies. As indicated above, this will take a major type of faculty development program to ensure that the present and incoming staff members have the expertise to accomplish the task. Furthermore, it will take equally sophisticated programs - and commitments - in the home life and work crew components if this shift in emphasis is to be achieved. In this regard, it appears as the major concern of the academic component is one of providing success experiences for these boys. Therefore, their instructional activities and performances criteria must be measured against this goal. Perhaps of equal importance will be the design of experiences which can help boys develop some measurable commitment to learning. This is quite a departure from the kinds of outcomes which accrue from the instructional efforts which now prevail. It is a big job to design the use of academic tools to support this outcome. One must suppose it will take continuous development and monitoring of instructional settings by an interdisciplinary academic team

(e.g., psychologists, curriculum specialists, social workers, discipline specialists, etc.) backed up by a Pupil Personnel Services Clinical support team. It should be added that in the home life setting and work crew setting similar professional personnel mixes would operate. In all three the Pupil Personnel Team might be expected to play the orchestrating role.

2. In this same vein, the individual needs of a boy would be paramount to the type of program he would undergo. This would represent a continuing process of monitoring by the Pupil Personnel (clinical) Team throughout the boy's stay at the School. The time on work crews and/or in the academic program would be a product of planned experiences rather than "hunch" decisions.
3. Because of the physical environment the School enjoys there should be serious thought given to developing an extensive program of outdoor education. With the facilities that are available, it seems highly appropriate that this be a major component of the academic atmosphere. Some careful curriculum studies should be undertaken in this respect and resources brought to bear to assist the faculty in developing a viable experience which promotes a quality of outdoor living that these young people have not previously experienced.

IV. SUMMARY:

The self study process the faculty has undergone pointed up a number of areas in which major improvements in the instructional program can be achieved. In addition, they have identified several

items of concern which are Institutional wide in scope but which impringe upon efforts to provide a unique treatment environment for these boys. Recommendations which are made here and in the self study and those to be made by the Visiting Committee should stimulate the development of Institutional, Division and inter-agency task forces. They, in turn, will hopefully embark upon the task of cooperative planning and implementation as to achieving maximal change in keeping with the expectations of the Division of Youth Services and the aspirations of many professionals at the Arthur G. Dozier School.

PHILOSOPHY AND OBJECTIVES

The emphasis on self concept and individual help by the local committee is commendable. The visiting committee agrees with this philosophy as stated in the Self Study report but we make these recommendations for improvement and implementation:

1. Provisions should be made for a frequent evaluation of this philosophy, at least once each year. Any statement of philosophy is of no value unless it is current and understood by all personnel.
2. Implementation of this philosophy is impossible without constant, well planned staff development programs; therefore we recommend the planning of a staff development program begin as soon as possible.
3. The present education program conflicts with the philosophy in many areas, in the written report as well as in the classroom, cottages and crews. The philosophy stresses the importance of individual instruction but the goals stated in subject areas as well as classroom procedure place great value on memory work. The staff development program should identify these areas of conflict and develop components of staff improvement to bring the total program in harmony with the stated philosophy.
4. The philosophy places value on "a relationship which encourages mutual respect." Many of the cottage fathers are not trained to implement this, therefore this relationship does not exist between the boys and the cottage fathers. The cottage fathers should participate in a staff development program designed to prepare them for their role in the total education program. In the future, the personnel selected for these positions should be carefully screened to

determine their ability to contribute to the total program as described in the philosophy.

5. The "crew" program as it now operates does not contribute to the objective to "get and hold employment" therefore we recommend changes in this program to achieve the desired objective.

The philosophy emphasizes the importance of the total impact of all aspects of the institutional program on the educational-personal growth of the boys. This implies the necessity of systematic, system planning and administration of all aspects of the institutional program. The committee believes that the present administrative structure of the institution should be examined with the purpose of assuring more effective coordination of all aspects of the program.

PUPIL PERSONNEL SERVICES

Pupil Personnel Services are ordinarily defined as those services rendered to children in a school or institutional setting that are non-instructional in nature. Such services are those activities usually carried on by social workers, psychologists, counselors, health personnel, and other professionals which are related to the growth, welfare, and healthy functioning of human beings.

The present training school activities that fall in the area of Pupil Personnel Services are:

1. Social Services
2. Guidance Services
3. Health Services
4. Spiritual Life Activities
5. Reception and Orientation
6. Recreational Services
7. Home Life Services

The organizational structure of the school at present does not combine the pupil personnel services into a single department, nor are these services sufficiently coordinated for the most effective program.

The committee feels that all of the activities in the school normally identified as pupil personnel services should be unified in a single department under an administrator whose title might be "Assistant Superintendent in Charge of Pupil Personnel Services." We would further recommend the following changes:

1. That Social Services be coordinated under a single director, and that the primary responsibilities of this department be individual case

work, intake conference and progress conference review, in-service training in individual and group behavior, and group work. Social Services also should be responsible for obtaining, coordinating, and disseminating relevant information about pupils to all appropriate departments, staff, and referral agencies.

2. That Guidance Services be available and coordinated in the instructional program and oriented to the present and future academic and vocational achievement needs of the pupils.
3. That health services include not only medical, dental, and nursing personnel, but also adequate resident psychiatric and psychological personnel.
4. That provisions be made for pupils of all faiths to have appropriate worship experiences, religious educational opportunities, and religious counseling.
5. That the orientation of a new student to the total training school program be the primary responsibility of a trained social worker. Other responsibilities of the intake worker should include coordination of personal history, health, psychological and educational placement data, and arranging for staffing of each new arrival as soon as possible.
6. That home life in the cottages and recreational activities be coordinated under a single director.

The committee recommends that the following goals be considered for attainment within the next five years:

1. That salaries for all positions be raised to the level necessary to

obtain staff with training and experience commensurate with that recommended by the Washington Children's Bureau.

2. That staff be provided in the ratio of numbers of staff to boys according to the standards recommended by the Children's Bureau or the American Psychiatric Association, and that staff members function according to their roles as professionally defined.
3. That qualified staff be provided to conduct research and evaluation of the efficacy of treatment.
4. That appropriate facilities be provided for the professional treatment program requirements in relation to the number of boys at the training school.
5. That provisions be made for staff meetings and in-service training for all staff by professional staff both within the institution and from the relevant fields of study.
6. That improved coordination of pre-placement and after-care services with the training school program be developed.
7. That the institutional philosophy be implemented in practice to better meet the individual growth and psychological needs of each boy at the training school.

PROGRAM OF STUDIES

General Description of Findings

Boys sent to the Florida School for Boys at Marianna are for the most part products of public schools whose programs have been woefully inadequate for them. In fact, the failure of the public schools to reach these boys is undoubtedly a contributing factor to their delinquency. It seems reasonable then that to return them to an educational environment which closely resembles the one they have already rejected is a serious mistake. What is this educational setting which they have rejected?

1. A four-walled classroom of sufficient size to contain 25 or 30 desks in uniform rows in which they are boxed for six or seven hours each day.
2. An authoritarian teacher who seldom seems to have the time or the desire to really know and understand them and who threatens frequently to send them to the principal or have them expelled.
3. Books, books, and more books--all crammed full of information far removed from the reality of their experiences and interests.

Some progress has been made in modifying this pattern for the boys at Marianna -- but much, much more needs to be done. And done soon.

Buildings take considerable time for planning and construction -- but the staff should begin now to organize their thoughts and actions in developing the educational specifications needed for designing a facility which could adequately house a unique instructional program for this school.

Staff development and curriculum planning do not require new facilities. Both are critical areas in this school and should receive

immediate attention in the allocation of human and financial resources.

Plans for staff development should be broadly based and included not just classroom teachers but also Family Life personnel and various work crew supervisors who are in daily contact with the boys. In-service programs involving these three groups should be planned to provide interaction experiences which are designed to improve personal relations with each other as well as with the boys. The major thrust in these in-service activities would be directed toward the learning-developmental needs of the boys. The entire staff needs to focus on helping the boys to develop positive inter-personal relationships with their peers and with adults in order that the rehabilitative process can begin.

Curriculum for this type of school must of necessity be unique and should be a result of careful planning by the staff working with highly qualified curriculum specialists. Individualization of instruction is a worthy goal, but teachers need guidance and direction on a continuing basis to cope with the variety of teaching and learning problems which arise. Special effort needs to be exerted on improvement of the reading program and the pre-vocational program. Choice of media, materials, and methodology now seems to be the responsibility of each classroom teachers, resulting in a piecemeal effort rather than a total approach to solving learning problems.

With these observations in mind, the committee wishes to submit the following general recommendations:

General Recommendations

1. A study of the institutional testing program to improve the process of making individual assessments and educational prescriptions.
2. Necessary scheduling changes to permit daily school attendance for all who can benefit from it, for at least some portion of the day.

3. Changes in the pupil evaluation system which would be more meaningful both to student and to public schools to which he may return.
4. Adoption of an ungraded program throughout both the junior and senior schools.
5. Renewed emphasis on the prevocational curriculum -- development of attitudes and understandings, and orientation to the world of work.
6. Additional staffing in curriculum and greater use of consultants in curriculum areas.
7. Improvement in selection of periodicals, books, and educational materials, making them more appropriate to age, race, sex, and personal interests.
8. Special emphasis on self-concept improvement through in-service education of entire staff.
9. Continued expansion of the reading laboratories and the reading program.
10. Reactivation of the music program in the schools, both choral and instrumental.
11. Involvement in educational research which will be meaningful in learning what work in the educational program.

AGRICULTURAL EDUCATION

I. Findings - Observations

1. The farm is totally production oriented and is in a run-down condition.
At the present time a full-time farm manager has not been selected.
2. There is evidence that the boys are involved in routine work which has very little meaning except to give them a change to get away from the main campus. Very little educational value is evident.
3. The farm supervisors have had no training in supervision of boys with multiple problems and can only issue orders and see that they are carried out.
4. The boys are given no responsibility other than "doing as they are told."
Therefore, they have no opportunity for leadership in work crews.

5. The opportunities for program development in such areas as forestry, wildlife, recreation, horticulture, etc., are unlimited with some of the finest land and variety of soil types owned by the school - some 1600 acres.
6. The size of the farm operation has been and is continuing to be scaled down considerably with the sale of several hundred head of cattle and fewer acres in row crops. Land taken out of production should be placed in a conservation management program.
7. It is my opinion that the present farm staff would be receptive to in-service training.

II. RECOMMENDATIONS

- B. A comprehensive program of agricultural education to meet the needs of disadvantaged youth should be initiated to replace the present production oriented farm program. It is proposed that the program provide experiences centered around agricultural and biological sciences which will assist students in building self-concept, experiencing success, developing leadership, seeking hidden strengths, and channeling these in productive directions.
- B. Recommended Procedures for Program Planning and Implementation
 1. A course of study should be developed, the core of which will center within the agricultural interest of the boys.
 2. Students should deal with selected problem situations in ag-mechanics or ag-science related activities.
 3. A great percentage of the instructional units should be taught on location, subject matter orientated toward situations arising from the operation of the land laboratory and could include:
 - (a) Care of animals, including horses.
 - (b) Production and care of plants.

- (c) Operation and maintenance of garden and other land-lab equipment.
 - (d) Basic mechanical skills.
 - (e) Conservation of soil, water, and other natural resources including outdoor recreation.
4. A dynamic teacher-student interaction in an interesting environment will serve to override those characteristics possessed by the students that have caused them to lack self-motivation which has resulted in their under-achievement.
 5. Students should be occupationally oriented and should become familiar with the world of work and job opportunities by involvement that would include:
 - A. Reading about job opportunities.
 - B. Hearing selected speakers.
 - C. Visiting agricultural businesses.
 6. The student involvement with the land laboratory could be used as a vehicle for teaching the academic skills necessary for school success in any area, namely communication, mathematics and science. Such an approach will deemphasize for a time the traditional logical or textbook learning procedures.
 7. Facilities, Equipment, Land Use
 Refer to the November, 1968 Development Plan for Agricultural Education submitted to Division of Youth Services and Arthur Dozier School for Boys for detail.
 8. This program could well relate to the program for pre-vocational experiences recently initiated in the senior school program, as well as the science program. More students need this broad type of experience program.

ART

Rationale For Art Education

Art is a branch of learning. It is a systematic application of knowledge and skills in effecting a desired result. It is a personal, sometimes unanalyzable, creative power. It, therefore, deals with ideas which by tools, processes, and materials is converted from abstraction to reality. It is a bringing forth of oneself in unmistakable terms which allow one to learn more than in most other endeavors about oneself. Art courses are also outlets for employing the student's mechanical inclinations. Such an escape valve for their frustrations can be a positive way for also introducing new ideas and attitudes that normally cannot be taught within the confines of a classroom. Such a process needs encouragement and serious attention, for art has too long in our culture been relegated to the non-essential sector of daily experiences.

Findings

1. Plant

The Art Shop Building is unfit as a learning environment. The structural soundness of the wood-framed building is questionable. The two rooms north and south of the main classroom are cluttered with items that are highly flammable. Toilet facilities for students are not available.

Artificial lighting on cloudy days or at night is not enough to permit safe working conditions. Ventilation on warm days is questionable. Generally, the cluttered character of the shop cannot be remedied even

with the present attempt at constantly painting the walls.

2. Equipment, Tools, and Furniture

Equipment, tools, and furniture are inadequate in number and are in poor condition. The unsightly, broken furniture does not build a creative environment. The placement and spacing of furniture is that of a 19th century classroom and not conducive to today's teaching ways.

3. Consumable Supplies

The recent allocation of \$200 per quarter for consumable supplies is sufficient and appears to have been well spent.

4. Requisitions

There seems to be some difficulty in obtaining necessary equipment through the requisition procedure. The instructor is never sure if his particular requisition is approved and when the item ordered will be delivered. This uncertainty creates difficulties for lesson planning.

5. Curriculum

The art course offers three distinct lessons: The first, or Folder #1, is "Warm-Up Exercises." Essentially, this lesson focuses on transfer type skills. Folder #2, "Your Idea File," as structured, does not allow for individual expression but continues developing transfer-type skills. Folder #3, "General Art," contains too many ideas that require more extensive background knowledge than most students would possess. The quality of student projects was low.

6. Instructional Materials and Visual Aids

There are not enough textbooks, resource books or visual aids for students.

7. Class Size

Class sizes vary widely. If the class size exceeds 16 students, the high density of students per floor space hinders any effort at constructive teaching or student participation.

8. Teaching Staff

The instructor's enthusiasm and constant searching for ways to make art more meaningful to his students are commended. His suggestion of a vocational art course for sign painting, lettering, and graphics is an idea worthy of attention. Ideas developed under such trying circumstances are apt to contain more merit than those developed in ordered environments.

Recommendations

1. Plant

A new building or space is required. To attempt remodeling existing structure would be a waste of resources and energy.

2. Equipment, Tools, and Furniture

A complete inventory and study should be conducted as to what equipment, tools and furniture would be most appropriate.

3. Curriculum

The Art Shop should be developed more as an Art Studio. The senior level program should be revamped and a new curriculum tailored to the student's needs created. The instructor's vocational art course should be researched given careful consideration. As a personal first thought, the idea possesses merit conducive to the needs of this type of student. The art course should be taught on an individual basis. This is one opportunity for students to express themselves, a need that was most evident to all members of the Visiting Committee and a need not being met.

4. Instructional Materials and Visual Aids

A library of materials, books, art objects, etc., should be instituted.

5. Class Size

A low teacher/pupil ratio should be maintained for the following reason.

Art has a psychological advantage, a psychotherapeutic effect resulting from the student's having to express himself. With this psychological advantage, plus others, every effort should be made to utilize this course, not only for the positive development of values and attitudes, but also for the possibility of enriching the visual environment of the school other than just at Christmas time.

6. Teaching Staff

A new instructor should be hired if the new vocational art program is established. He, in addition to his credentials as an art teacher, should also have respect and be sensitive to the psychological aspect of art.

Health/Hygiene

Commendations

The academic areas of personal Health/Hygiene, biological and physical science are coordinated to the extent that they become a relative series of progressive phases. Four full-time instructors and one part-time instructor compose the faculty for the combined subject areas, with two full-time and one part-time instructor primarily concerned with Health/Hygiene.

The coordination of subject areas and the intermeshing of course content is commendable. Some areas of the course content are irrelevant and are not applicable to the students' daily living and health routine. The major portion of the proposed content of the Health/Hygiene is worthy and in most respects in appropriate sequential phases. However, the materials selected and the methods employed in the presentation and attitudinal and behavioral change are lacking the pupil involvement necessary to accomplish the stated objectives.

There is little encouragement and minimal planning for immediate carryover into daily habits or for strengthening attitudes for future enhancement of good health and well-being. Although anatomical models, charts, and other projected and non-projected visual materials and equipment are available for use, it is apparent that these aids often are not utilized to a great extent or in a meaningful manner. Improper selection of visual materials and lack of the advantageous use of equipment and aids in many particular situations is readily evident. The evaluation of student progress is based on written tests, class

participation, and teacher observation. In order to provide a more positive and effective means of deriving the desired resultant behavior and benefits from the Health/Hygiene program, it is recommended that:

Recommendations

1. An investigation and assessment of community health agencies and medical services be made for the purpose of establishing contact with reservoirs of health information, counsel, and assistance. It is further suggested that representative members of the professional health and medical community be contacted and these services be in the health education program.
2. A committee composed of members of the Health/Hygiene faculty and representatives of the proposed curriculum materials selection staff search out, review, and select appropriate and pertinent audio and/or visual materials for presenting various aspects of health education and personal hygiene.
3. The teaching methods be varied to include discussion, peer evaluation projects, demonstrations, etc.
4. The materials for instructional use be selected on the basis of the respective pupil-group level of understanding.
5. A plan be designed to encourage and implement the development of the students concepts concerning his body, its function and proper care in daily and routine practice.
6. Methods and principles to encourage self-discipline and self-direction be employed as a means of developing personal and social growth.

7. A registered first aid course be offered for those who have progressed to this level and are capable of engaging in such a course of study.
8. A plan be formulated for active cooperating interchange among the campus divisions, social services, medical services, house staff and the Health/Hygiene faculty.
9. A laboratory type setting be provided and used to provide a more flexible and suitable course of study of this subject material.
10. A systematic plan of evaluation be designed to reflect the pupil progress as he perceives it and as determined by the teacher determinations through previously designated objective criteria and subjective observation.

Industrial Arts.

Commendations

1. The instructor and staff of the Industrial Art Department of the senior school are commended for implementing certain portions of the recommendations as stated in the Steeb's and Geil's report, A Survey of the Industrial Arts Program of the Arthur G. Dowler School for Boys, October, 1968.
2. The cleanliness of room, equipment, and furniture and the orderliness of equipment, books, and activities reflect the above-normal enthusiasm of instruction and students and should be encouraged by the administrative staff.
3. The clarity of study program and its manner of execution left

more class time than normally for learning and performing lessons;
this is commended.

4. The recent provision of \$200 per shop per quarter for expendable supplies and small purchases has been well spent and is a credit to the instructor's leadership.

Findings and Recommendations

The survey of the Industrial Arts Program conducted by Dr. Ralph V. Steeb and John J. Geil in October, 1968, and titled A Survey of The Industrial Arts Program of the Arthur G. Dozier School for Boys, is still valid and their recommendations that have not been implemented need to be acted upon.

Science

Commendations

Strong teaching in the science areas has been noted. This strength is in terms of subject organization, class organization, and teacher student rapport.

Recommendations

1. The so-called "traditional" approach to teaching should be deemphasized. This means less lecture and less textbook-workbook exercises. There is little teacher-pupil or pupil-pupil action.
2. The science curricula should be geared more to the student's level in terms of interest and ability.
3. These students would benefit from learning through doing. This implies more "laboratory" work, experimentation, inquiry, etc.

4. Facilities and equipment are outdated and not adaptable to the type science program needed here. Such equipment and facilities should be developed consistent with a laboratory approach and should be flexible enough to incorporate a variety of activities.
5. There is a strong possibility that a teacher in-service education program, emphasizing new developments in science, would be beneficial.

Prevocational

Commendations

The occupational readiness classes represent a good beginning in providing some prevocational experiences in the senior school. The type-writing classes also contribute toward vocational preparation.

Recommendations

1. Curriculum should be related to work experiences at the school.
2. Work experiences should be slanted less to production and more toward education.
3. Consideration should be given to planning a combination school-work program (similar to a high school DCT program) involving work both at the school and in the community.
4. Employment of a work experience coordinator is essential in implementing recommendations 1 - 3.
5. Exploration of financial assistance through the Vocational Education Act and its amendments should be made, enlisting the aid of specialists from the State Department of Education.

Mathematics

I. Senior School - Remedial Program

The Committee found the Remedial Mathematics Program in the Senior School to be extremely well organized and in keeping with both the philosophy and goals as stated in the self study.

A well defined pretesting, placement, post-testing and individualized teaching process was evidenced in the classroom.

A wide variety of educational media was employed to make the subject content meaningful to the student.

Conferences with the students indicated good attitudes and orientation as to relevance of their performance to their future needs in society.

The interaction of teacher-pupil was at a high level which sharply contrasted with many other classroom visitations.

II. Senior School - Phase I-VI

The observation and discussions with both teacher and pupils indicated the math orientation is of a practical nature involving skills and understandings needed for successful living in society. This is in keeping with the stated goals.

The phases as described would meet the needs of a wide variance of ability levels and are also in keeping with the goals and philosophy as stated.

Students interviewed in this area also demonstrated a high level of realization of the relevance of the subject content to their future daily lives.

The use of multi-media methodology was not observable during the visitation period.

Junior School

The committee observed a traditional teaching methodology with no indication of individualized instruction or a reading level commensurate with the surveyed ability of the student population during the observation period.

A noticable lack of materials other than pencil, paper and written instructions was apparent.

Recommendations:

- 1) It is suggested that an activities approach may be of assistance in student comprehension on the Junior School level; as well as a motivational device. Many expensive commercial educational materials can be adapted for classroom use at very little cost and can aid in the learning situation.
- 2) In keeping with the philosophy of developing a good self-concept, it is suggested that student work or projects be displayed within the classroom irrespective of level placement or quality of work.
- 3) More direct student involvement in some active participation within the classroom would be desirable as opposed to the overt apathy of many students observed. This is accomplished successfully in some classrooms visited.
- 4) An inservice program is suggested in math methodology (not modern math) as pertains to the multi-media and activities approach to teaching math to this student group. This suggestion is made with due consideration given to the mobility of the student population and the belief that it will aid the teacher in the daily classroom situation encountered.

This teaching method would emphasize developing the student's ability to cope "with life situations" as stated in the Self-Study Introduction;

while still involving him in content.

Reading and Related Language Arts

Observations:

1. One well equipped and well organized reading program in the Senior School with corrective instruction geared to the needs of the individual.
2. Evidence of lack of drive and motivation on the part of most students. A defeated attitude and negative sense of self-worth prevalent in most classrooms. Yet most boys followed directions cooperatively.
3. Available audio-visual media, reading machines and other instructional materials not in use in some classrooms or not used to full advantage. (Reading machines, projectors, film strips, overhead charts, programmed reading materials, books)
4. The use of only Standardized Tests to determine the level of performance and capacity is not adequate for these boys who are several years behind. (A more thorough diagnosis and analysis of reading retardation problems needed to determine if each measures up to his mental capacity)
5. The present traditional marking system or grading system can be very damaging to the self-concept and helps promote a continued negative and defeated attitude toward reading and learning in general.
6. Observation showed evidence of lack of an individualized reading approach to help each boy at the level he can learn successfully and to meet his special reading problems.

7. There was not an organized and systematic effort to teach the basic word recognition and word analysis skills in some classrooms that are so essential to independent work attack.
8. The use of the dictionary was observed in most reading and language arts classrooms which was good, but the use of the dictionary to look up a long list of words and copy meanings appeared to be busy work.
9. Lack of an organized and effective program for teaching the spelling principles, handwriting, correct language usage and listening skills was observed in some classrooms.
10. The use of available library books and supplementary reading materials in classrooms appeared to be "untouched" by many of the boys.

RECOMMENDATIONS:

1. Employ a certified and competent Reading Specialist with the expertise to organize, direct and coordinate the total reading and related language arts curriculum.
2. Provide reading in-service programs and reading workshops for teachers. (A competent teacher is the key to improved instruction. The effective teacher will remain an active learner.) All teachers, in order to keep pace with new trends, methods, techniques and materials of reading should participate in staff improvement programs for that purpose.
3. We recommend an individualized remedial and corrective reading program for each boy based on diagnosis and analysis of his own particular problems, and instruction initiated on the level at which he can succeed. This will help motivate and build positive attitudes. (A feeling of success is the greatest motivation.)

4. Since these boys are from two to four years behind in reading and related language skills, and by virtue of the fact they are only in this school for a few months, we recommend an intensive remedial program starting at the point of breakdown and proceeding thoroughly and systematically to teach the following basic skills: (First, give each an Individual Reading Inventory)
 - a. Phonetic analysis: The phoneme, grapheme, morpheme, sound-symbol relationships.
 - b. The basic spelling patterns.
 - c. Word-building clues (adding inflectional endings, s, ed, ing; prefixes, suffixes.)
 - d. Context clues and word form clues.
 - e. Word meaning: Homonyms, antonyms, synonyms, heteronyms.
 - f. Syllabication of accent clues.
 - g. Teach the exceptions to the code-emphasis approach and the non-phonetic and functional words by sight method.
 - h. Comprehension skills.
5. More pupil involvement and active participation in his learning. There must be pupil interaction and active involvement in their own learning if we expect to spur the will to learn.
6. More use and better use of the available reading machines (Hoffman, Controlled Reader, Language Masters, Craig Readers) and other printed programmed material.
7. Other materials needed to upgrade program:
 - a. Individual Reading Inventory Test (Spache is good).
 - b. Readers Digest Skill Builders (grades 1 - 8).
 - c. Transparencies on basic skills (commercial and home made).

- d. More phonics records and film strips for all reading and language arts teachers.
- e. More high-interest, low-reading level paperback type for each classroom. The Classics Illustrated series is good. This should be kept accessible in the classroom to encourage further reading for fun to supplement the individualized remedial program.

STAFF AND ADMINISTRATION

The Visiting Committee concurs with the basic concepts set forth by the Self-Study Committee for School Staff and Administration. As a follow up on their problems and concerns they have identified, we make the following recommendations:

1. There needs to be careful attention to the potential reorganization of the administrative responsibilities to bring more coordination between the Junior and Senior School as well as coordination between the academic program, the cottage life program and the work crew program. In this vein, we recommend that a careful task analysis be carried out for the entire Institution. This would include a thorough look at the mission and objectives of the Institution as they are perceived by the Youth Services Division; thus projecting the organizational structure which will best support the implementation of these identified functions. This study would include a thorough look at the need for the incorporation of and the coordination of basic functions to staffing patterns (e.g., professional - paraprofessional - other support personnel). As one example, present lines of responsibility may not support a twenty-four hour a day treatment environment.

From this study the committee believes a table of organization can be developed which will reflect the responsibilities that must be carried out to maintain a treatment environment and then efforts can be made to be sure that personnel are assigned commensurate with the performance characteristics required by the table of organization.

2. It appears essential that a salary schedule be adopted by the Division of Youth Services which provides for increments under the following conditions:
 - a. Certification rank according to State Department of Education regulations and/or rational concepts of differentiated staffing.
 - b. Beginning salaries which can realistically compete for people of high quality to come to this geographic area.
 - c. An increment (probably 20%) to reflect twelve month work responsibility.
 - d. Increments for years of service.
 - e. Provisions for leave with pay (sabbatical leave) to allow for improved professional competence development of career employees.
3. The Visiting Committee fully recognizes that an increase in salary is no guarantee that instructional goals will be achieved. Therefore, the Committee recommends an intensive, comprehensive staff development program designed as a process to continuously improve the staff in the instructional skills needed in this School. This might include a number of general strategies of teaching such as individualized instruction, use of technology, evaluation and the like. It might also include more special competencies in remedial programs. Careful evaluation of all staff members should be undertaken to determine what types of faculty development programs should be undertaken with the highest priority. This evaluation should be done at frequent intervals.

STUDENT ACTIVITIES

Considering the primary functions (as stated) of the Arthur G. Dozier School for Boys, we of the Visiting Committee see the need for a comprehensive program of student activities. It has been noted that individual staff members and administrators also recognize the need for such a program. In light of this awareness and ensuing action, the Committee makes the following commendations:

1. A realistic approach to needs and interests of the students is evidenced and expressed in the self study.
2. Implementation of a student council--this is a meaningful beginning but more student involvement is needed here. Furthermore, student recommendations arising from council action should be considered carefully and acted upon when possible.
3. There has been an increase of student activities including Boy Scouts and baseball programs.
4. Student trips including F.S.U. Circus trip and others are to be commended. These need to be expanded upon in both scope and frequency.
5. Campus movies.
6. Work being done on existing facilities - ball fields, gymnasium.

However, in terms of the objectives and philosophy as stated in the self study, a program of student activities which would meet these objectives and which is congruent with the stated philosophy severely lacking. Generally speaking, more planned activities are needed, the program as it now exists is limited in concepts and practice with notable exceptions as stated previously.

More cottage activities, special events and outdoor programs need to be implemented. The entire School population needs to utilize and benefit from the gymnasium facilities which at this time appear to be adequate. Students require more free time to choose individual pursuits, perhaps through planned-for experiences where the student may choose his own activity within a framework. There is a tremendous amount of "do nothing time" and prescribed inactive time both mentally and physically. Considering the previous observations the Committee makes the following recommendations:

1. A written policy is needed designating authority and responsibilities for the student activities program. Such policy should take into account development, coordination and implementation of the activities program. A monitoring system to ensure that policy is being carried out at all levels must be implemented.
2. The activities program should be developed in terms of individual students' needs and interests. This has the following implications:
 - a. Development and use of a personal interest inventory relating to activities, hobbies, etc. This should be an on-going process beginning at R & O and redone every three months.
 - b. Development and implementation of an intramural program for students. This should center around the cottage and involve all boys. The program should emphasize:
 - (1) Athletics--team and individual (i.e., basketball, football, soccer, volleyball, flop softball, pingpong, track, swimming, horseshoes, etc.)
 - (2) Indoor games.

3. Student representatives at the cottage level are needed concerning the activities program.
4. Reinstatement of interscholastic athletics. This should be an outgrowth of the intramural program and is a long range goal. Recommended sports include:
 - a. Swimming
 - b. Track
 - c. Baseball
 - d. Basketball
 - e. Football
 - f. Others according to interest
5. Develop and implement interest groups (clubs) in the following general areas:
 - a. Publications
 - b. Academics
 - c. Dramatics
 - d. Music
 - e. 4-H
 - f. Art
 - g. Others according to interest
6. Directorship at the cottage level is essential. A program, no matter how well conceived or developed, cannot succeed if the leadership is lacking or absent at the implementation level. This implies the need for cottage parent involvement and leadership. It also implies that a part-time recreational aid for each cottage is needed. The cottage parent should ultimately be responsible (at the cottage level) for

carrying out the program developed by the activities director.

7. Two full-time recreation directors are needed. These should be recreation people with a degree or certification in the area of physical education and/or recreation. The recreation directors' schedule should be developed in line with the needs and function of this particular school. This implies that an 8:00 a.m. - 5:00 p.m. schedule is not appropriate here. These directors are needed after 5:00 p.m. when the recreation or activities program would be on going; 2:00 - 10:00 p.m. for example.
8. More boy-girl activities are needed. Coed events should be scheduled on a bi-monthly basis.
9. More community-school interaction is needed.
 - a. Community Boy Scout Troop involvement
 - b. Community little league involvement
 - c. Attendance of community churches
 - d. Attendance of community schools on a merit basis
 - e. Others as indicated
10. More activities meaningfully related to vocational interests are needed.
11. A school newspaper which is a result of predominantly student efforts is needed.
12. Facilities should be put to maximum use by students.
13. Each student should be issued tennis shoes and swimsuits with clothes issue.

Recommendations Relating to Facilities and Equipment

1. Pool heater to make year-round use possible
2. Hard top all basketball areas
3. Install regulation basketball goals
4. Update and improve cottage facilities and equipment
 - a. Weights
 - b. Adequate pingpong equipment
 - c. Record players - records
 - d. Adequate library in terms of interest (daily newspapers, magazines)
 - e. Adequate table games (pool, chess, checkers, cards, etc.)
 - f. Miscellaneous (as required according to Interest Inventory)
5. Implement a meaningful program of outdoor education as related to:
 - a. Recreation, camping, fishing, etc.
 - b. Curriculum
6. Develop a par 3, 9-hole golf course on the grounds
7. Build a 440 . yard oval track.
8. Lighting is needed for all outdoor play areas.
9. A suitable number of tennis courts (10) need to be built.
10. Keep existing equipment in good and constant repair and make this equipment more readily available to the students.
11. At least 2 more softball fields are needed to accommodate the number of students in the program.

EDUCATIONAL MEDIA

I. Library Facilities and Services

This committee appreciates the thought, planning, and efforts of all persons involved in the establishment of the existing library facilities. We would like to offer several suggestions for further development and improvement of the facilities and for extending its services. Most of these suggestions have been recognized as needs by the staff involved in the self-study.

1. There should be structured, concerted efforts put forth to get and keep the student population involved in the use of library facilities. We do not believe that the materials are currently being circulated widely.
2. The feasibility of extended library hours should be studied.
3. Efforts should be made to staff both libraries with certified personnel.
4. Teachers should become thoroughly familiarized with the library materials through in-service arrangements.
5. Teachers should be involved in the selection of library materials.
6. The magazines subscriptions list is grossly inadequate. Provisions should be made for securing a very wide selection which will be of value and of interest to the student population.
7. We approve of the present trend toward purchasing paperback volumes when available.
8. Additional volumes should be added regularly as funds permit. We suggest that extreme care be exercised in the selection process, assuring that volumes will be those applicable for whom they are intended.
9. We endorse the present plans for extending the physical area of the library to incorporate a listening room, reading room, and a storage area for equipment.

10. The physical space for the Junior School library appears inadequate.

We recommend a larger area.

11. The Staff library materials should be expanded.

II. Audio-Visual Equipment and Materials

The quantity and variety of audio-visual equipment and materials appear quite adequate in most areas as they are currently being utilized. We feel that more extensive usage should be made of the items which are presently available. As an illustration, we wish to point out that in two days of observations this committee observed the following equipment usage:

1 only - Tape recorder

1 only - Movie Projector

1 only - Record Player

1 only - Overhead Projector .

1 only - Hoffman Reader

Craig Readers at one location only

We did not observe the usage of film strips, radios, televisions, film strip previewers, Controlled Readers, opaque projectors, or listening posts; all of which are available for usage. This is not to be construed as a blanket indictment depicting rigidity of method or techniques in teaching, but rather as a suggestion that teachers be encouraged to explore the feasibility of increased usage of the materials and equipment currently available, with the idea of improving the educational program. In-service staff training might prove valuable in this endeavor. A central storage and checkout area should be made available for audio-visual equipment and materials which would make these aids accessible to staff from both campuses.

III. Other Instructional Materials (Texts, Workbooks, Teacher-Made, etc.)

In some instances the materials being used in classrooms do not seem to have high relevance when the objectives and philosophy of the total educational program are reviewed. We suggest a deliberate and thoughtful exploratory search into the materials being used, the techniques of presentation and, an assessment made of their validity in keeping with your overall objectives. We do not believe that a basic academically oriented program which seems to be in practice to some extent, will serve to promote the behavior changes which we believe should occupy high priority in this setting.

IV. Classroom Physical Appearance and General Learning Atmosphere

We contend that the classroom environment is a strong contributing determinant in the learning situation. A few classrooms presently show ingenuity and creative efforts on the part of staff members. There are others, however, which do not display such efforts. We suggest that each staff member take a critical look at his classroom with the idea of seeking ways of making improvements which will make the room more attractive and conducive to learning. We would like to see more evidence of students work displayed. Most classrooms should house a greater number and variety of supplementary materials available for the student to explore. We propose that the most important factor in any classroom setting is the teacher himself. In several instances our observations revealed that teachers are not becoming actively involved in the learning situation. This is not to imply a superiority of one teaching method among methods, but rather to emphasize the idea and belief that the teacher should function as an active participant in the learning situation. We would like to see more teacher-pupil and pupil interactions in the classroom.

PHYSICAL FACILITIES

Foreward

The survey was based upon the following activities:

1. inspection of all school-used buildings (46);
2. interviews with teachers, administrators, and staff;
3. talks with students;
4. studies of the following reports:
 - a. Arthur G. Dozier School for Boys,
Self Study, January - April, 1969;
 - b. The Arthur G. Dozier School for Boys,
Legislative Budget Request,
July 1, 1969 through June 30, 1971; and
 - c. The Florida Children's Commission
Reports on the Florida Industrial School for Boys,
1953 Series, Report #2; and
5. observation of the activities as they were executed within the facilities.

Any omissions, errors, or misrepresentations are solely the author's responsibility and are not meant to distract from the fine cooperation given by the school personnel when questioned.

The comments, phrases, and sentences placed between quotation marks are comments, phrases, and sentences taken from the Arthur G. Dozier School For Boys, Self Study, January - April 1969.

The word "facility" as used in the report means buildings, furniture, equipment, ground, animals, trees, flowers; in short, any physical object that can be used to effectuate an action, operation, or course of conduct.

Commendation

Lack of sufficient funds, old equipment, and constant repairs make the following commendations more deserving than usual:

1. the constant attention and energy given to cleanliness,
2. the remodeling and equipping of both libraries,
3. the indoor repairing of gym,
4. the staffs' efforts to maintain and repair obsolete equipment, and
5. the school administrators'
 - a. continual effort to improve indoor environments, and their
 - b. new 10-day per month program of rehabilitating defunct facilities while at the same time maintaining the remaining facilities.

Outdoor Environments

The Site

The 1400-acre site is one of the school's most valuable teaching aids. The fine quality of vegetation, the great quantity of trees, and the undulating ground characteristics are landscape resources that can be used to help meet the immediate needs of many students. The objectives of "Changing his attitude, his behavior, and his educational level" depend, in part, on the man-made alterations made upon that landscape.

The Facilities

At the present time the school's man-made facilities are a minus factor in the school's rehabilitative efforts. The calming effect produced by the tall slender pine trees upon the frightened student entering the

school for the first time is no doubt quickly dispelled by the wired-cage detention cell he sees behind the R/O cottage. The unfortunate placement of that structure so close to the entrance makes the student's first impression, which is so valuable in the school's "treatment process," a failure rather than a success.

Once in the program at the R/O Cottage, the student's image of the wired-cage cannot fail but to be reinforced. Constant reminders of a physical nature are all around him. The bareness of the cottage exteriors; the excessive segregation of every activity; living here, working there, and studying over there; the look up the hill where authority resides; and the longing to run down the hill to freedom are examples of symbolic incompatibilities. Such incompatibilities between land and activities make a poor beginning for psychological rehabilitation.

Other incompatibilities also exist in other forms. Dependent activities are hampered by needless separation or long distances. Classrooms for senior high school are spread too far apart for effective intercommunication between teachers and teachers, between teachers and staff, and more importantly between staff and students. Library is separated from the main building of the senior high school which negates its role as the academic center. The distances between the senior high school, art shop, industrial and electronic shops are too excessive. Walking for students from cottages 139 and 144 to dining hall in building 113 covers four blocks, which distance is no comfort on rainy days. Warehousing in building 164 is $\frac{1}{2}$ mile from processing in building 230. These separation distance problems, plus others, consume an inordinate amount of human energy and scarce resources that could be

better applied in the student's individualized rehabilitation.

Indoor Environments

General Survey

Buildings are generally inadequate for housing assigned activities. Size, configuration, color monotony, intentional and unintentional damages, inappropriate materials, and the quality of spatial bareness make up in part the inadequacies.

The Cottage

The room arrangements within the cottages hamper any program which attempts to inculcate respect and understanding as an individual or as an individual functioning in a group. The student has no place that he can call his own. The constant interactions of 35 to 40 students for 17 of 24 hours are not relieved in any manner by providing the student with a quiet space of his own. His every action is seen, even those of a biological nature. His personal property is essentially the property of all for no secured personal space is provided. Each activity is segregated. His locker is in one room and his bed in another, generally at opposite ends of the building. In others he sleeps on one floor and travels two floors down to shower or wash up. These circulation crossing patterns distract and hinder other students who are attempting to read, to write, to watch television, or in whatever social or personal activity they may be engaged in.

The School

The tender of the criticism cited above also applies to the school buildings. The small classrooms housing large numbers of students distract from any attempt at learning experiences. In fact, the architecture and

and furniture mitigate against pupil-centered learning and reinforce teacher-centered practice, the present situation in most of the schools' classrooms. Only in the industrial arts and art shops of the senior high school was there an exception in the teaching method.

The slip-slod manner of putting things together are too numerous not to affect the physical environment. Shoddy-formed brick walls; unpainted wall and ceiling areas; unpatched areas; poor, exceedingly so, color selection, which is detrimental to academic exercise; untouched damaged areas; dungeon-type barber shop; broken windows; torn and misplaced window screens; painted walls peeling; and a wooden shack as an art shop all make further major repairs a waste of money.

Supporting Facilities

Supporting facilities range from good to very bad in physical conditions. The remodelled sectors of the administration building are the best physical environments other than the two remodelled rooms used as libraries. The large dining rooms resounding in above-the-normal noise level are not even relieved of its institutional character by the gaily painted window shutters. The maintenance facilities are deplorable - physically, functionally, and visually. The make-shift roof between two buildings to form a warehouse is an attraction for breaking in. The overheated laundry shop is no better than a factory with child labor working in it. The empty dairy building is an invitation to mischievousness. The ice house is mislocated.

In summary, the dried-out wood framed members are primed for burning. The tragedy of 1917 which aroused the collective conscience of the

citizenry could once again occur. The narrow staircases from many of the second floors of cottages are insufficient to handle 40 boys in an emergency. The cheap wallboards are as flammable as tinder. The open rooms across the buildings are funnels for channeling fire.

Furniture and Equipment

Furniture is inadequate in number, is in nearly every case in poor condition, is marred, is unfinished, is incomplete, and is of a design not appropriate for the task it must fulfill.

The metal beds, lined like soldiers, rob the student's individualism while sleeping. To dress he must cross the entire length of the cottage to a locker that is non-lockable. As a result, personal possessions, even of the smallest value are not possible. Insufficient number of lavatories (approx. 6 for 40 students), water closets (5 to 6), and shower heads (6) are standards per cottage. In the activity rooms, the hardwood chairs, also lined like soldiers are hardly conducive to a homelike atmosphere. No desks for studying, broken nets on ping pong tables, and wornout gaming equipment are hardly capable of helping to round out evening and weekend activities.

In short, the furniture is of a negative value for the school's goal of a "complete educational program of a functional nature." Even supporting equipment, water pumps, boilers, meat cutters, farm tractors, and athletic equipment, are out-of-date, overworked, army surplus, and broken. Keeping them in operation is a credit to the staff.

Problems

The analysis has brought forth a myriad of problems which have been

condensed and grouped in the following manner.

1. Building materials used are generally ineffective, unsightly, and of poor quality. Soft wall boards in cottages are unable to withstand abuse. On the other hand, glazed tiles from floor to ceiling in every room negates any images which the ward cottage may invoke.
2. Overutilization, and at the same time underutilization, of space exists, especially in the cottages. Otherwise overutilization of spaces in the school, and maintenance of buildings is a serious and hazardous problem.
3. The lack of color, except for the canteen and the innocuous shutters in the dining room, and the color stimulus hamper the coordination of "the total educational efforts of the institution."
4. The continual activity of renewing broken equipment, especially equipment that requires specialized skills, presents the school's staff of 15 to 20 technicians from performing their primary task of remodelling old spaces for new uses.
5. Separate locations of interdependent activities in many cases utilize unnecessarily resources and human energy that could be better applied in advancing other activities.
6. Underutilization of resources now present at the school could "provide a program of good, healthy habits by developing behaviors involved in maintaining physical and mental health in small group situations and as a participant in small peer groups." Existing resources are as follows:

- a. horses - their care, training, and riding,
 - b. crop farming,
 - c. flower gardening,
 - d. animal farming,
 - e. fish farming, and
 - f. timber farming.
7. Architecture is a negative value as a usual aid in overcoming the boys' lack of motivation, short attention span, aggressiveness, and frustration.
8. The unfortunate siting of various activities increases the rehabilitative task.

Examples are as follows:

- a. administrative building on hill - a symbol of authority,
- b. detention cage close to main entrance,
- c. library separated from senior high school,
- d. art and industrial shops down-the-hill from the senior high school
- e. processing plant separated from warehouse.

Objectives

Facilities in and of themselves are not isolated entities but are an integral part of accomplishing the school's objectives. Since 80% of what man learns is learned visually, architecture becomes most important. Facts supported by scientific reasoning, now being developed at the University of Utah and by Dr. Humphrey Osmond and Dr. Edward Hall, are proving beyond a doubt that one's physical environment is important in one's having good mental health.

At Arthur Dozier School for Boys, architecture cannot be sacrificed to economy nor to insensitive designers. To do so will make the task of "social training, development of acceptable attitudes and behaviors, and constructive satisfying human relationships" almost impossible. Today approximately 25% of the students return to this school, while another 50% go to other correctional institutions. This process is not economy in the utilization of state physical resources but, more importantly, in the state's responsibility for developing the boy.

Warehousing the boy for a short period of time in warehouse architecture will not be conducive for developing "concepts and values that will enable them (the students) to adjust to society." Therefore, we strive to reinforce positive values. To accomplish this goal, the following objectives are offered as criteria by which to measure future architectural projects:

1. to create imaginability of a positive kind in order that "the child will develop a more open and inquisitive mind" and will be encouraged "to explore new concepts." Art tests, recognition tests, visual awareness tests, and others could measure the degree of imaginability acquired;
2. to provide architecture that not only houses well the activities but architecture that can be used as visual aids by the teachers;
3. to provide architecture that symbolizes and inculcates into the boy values of warmth, friendliness, gaiety, spontaneity, hope, a sense of thisness and hereness and that assure "each youngster of his basic worth as an individual and of interest in and concern for him;"

4. to create facilities that are flexible in meeting population changes, that are flexible in terms of expandability, changeability, and contractability;
5. to use architecture for establishing between activities to be performed and individual dispositions;
6. to use the physical environment as a means of motivating the individual, of arousing his interest, and satisfying his needs disposition;
7. to design physical configurations beneficial to group living experiences; and
8. to recognize and utilize facilities not as isolated entities but as integral means of accomplishing school's goals.

Long-Range Efforts

The recommendations are divided into two parts, long- and short-range efforts. Neither are isolated from the other but are designed to satisfy immediate needs within the context of satisfying long-range needs.

1. To hire an educational physical facilities planner to analyze, and prepare a comprehensive facilities planning program for the next twenty years. He should serve on curriculum committee, operations committee, and other related committees, as well as be aware of the school's philosophy, the political process it operates under, be sensitive to the boys' needs, and be technically capable of integrating population studies, transportation studies, curriculum studies, agriculture endeavors, climate, terrain,

2. to establish building material standards and specifications in cooperation with local and national firms;
3. to study ways and means of utilizing more effectively the 1400 acres of land;
4. to study ways of integrating school facilities with community facilities in ways that will strengthen both school and community;
5. to research in-depth types of furnitures that are durable, non-destructible, and at the same time well designed and functional for uses by boys in the cottage, school, and supporting areas;
6. to investigate with an architect types of architecture most suitable for this school and still be called architecture; and
7. to use physical facilities to erase forever the need for admonition in a similar report in 1953, "regret to say the present management of the school does not come up to your committee's expectation."

Short-Range Efforts

The following recommendations are those that can be begun immediately:

1. to apply color after consulting either a color specialist or informed designer to both the exterior and interior of cottages, schools, and maintenance facilities;
2. to break up the large sleeping spaces into smaller units;
3. to rearrange bed-locker combination into units that will provide individualized spaces within the units mentioned under Item 2;
4. to institute programs beyond those of lining up beds and chairs and cleaning that will enhance the physical appearance of the cottages, for example - gardening, making furniture, painting,

and repairing, and at the same time apply paints for above activities toward trips, prizes, and other rewards;

5. to hire a competent building superintendent to supervise and solve the day-to-day building problems;
6. to no longer copy any physical forms used in the past for this will insure failure for any new program;
7. to prepare a master plan showing all buildings, natural features, land contours, and utility lines for purpose of making future decisions on facilities; and
8. to utilize the resources of the art and industrial shops for adding amenities to the various sections of the school plants.
